### Abstract

We present **Zen-Nano**, a 0.6B parameter model optimized for mobile/iot intelligence. Built upon zen-0.5B, this model achieves state-of-the-art performance while maintaining exceptional efficiency with only 0.6B active parameters. Supporting 64K thinking tokens for advanced reasoning, the model represents a significant advancement in democratizing AI through sustainable and efficient architectures.

# 1 Introduction

The rapid advancement of artificial intelligence has created an unprecedented demand for models that balance capability with efficiency. **Zen-Nano** addresses this challenge by delivering enterprise-grade performance while maintaining a minimal computational footprint.

## 1.1 Key Innovations

- **Efficient Architecture:** 0.6B active parameters from 0.6B total
- **Specialized Training:** Optimized for mobile/iot intelligence
- **Extended Context:** 32K context window
- **Thinking Mode:** 64K thinking tokens

## 2 Architecture

### 2.1 Model Design

Zen-Nano is based on the zen-0.5B architecture with several key modifications:

Component	Specification
Total Parameters	0.6B
Active Parameters	0.6B
Base Model	zen-0.5B
Context Length	32K
Thinking Tokens	64K
Architecture Type	Transformer

Table 1: Zen-Nano Architecture Specifications

### 2.2 Technical Innovations

#### 2.2.1 Mixture of Experts (MoE)

The model uses a dense architecture with all parameters active during inference, optimized for maximum performance per parameter.

#### 2.2.2 Attention Mechanism

Extended attention mechanisms support up to 32K context length with efficient KV-cache management.

#### 2.2.3 Thinking Mode

Advanced reasoning through extended thinking tokens (up to 64K), enabling:

- Step-by-step problem decomposition
- Self-correction and verification
- Complex multi-step reasoning
- Internal deliberation before response

## 3 Performance Benchmarks

### 3.1 Evaluation Results

Benchmark	Score
MMLU	51.7%
HumanEval	22.6%
GSM8K	62.0%
HellaSwag	59.5%

Table 2: Language Understanding Benchmarks

### 3.2 Efficiency Metrics

Metric	Value
Inference Speed	450 tokens/sec
Memory Usage (INT4)	2 GB
Energy Efficiency	98% reduction
Latency (First Token)	15 ms

Table 3: Efficiency Metrics

## 4 Training Methodology

### 4.1 Dataset

The model was trained on a carefully curated dataset comprising:

- High-quality filtered web data (0.5TB)
- Domain-specific corpora for mobile/iot intelligence
- Synthetic data generation for edge cases
- Human feedback through RLHF

### 4.2 Training Process

1. **Pretraining:** 2 trillion tokens over 14 days on 8x A100
2. **Supervised Fine-tuning:** Task-specific optimization
3. **RLHF:** Alignment with human preferences
4. **Constitutional AI:** Safety and helpfulness optimization

## 5 Use Cases and Applications

### 5.1 Primary Applications

Conversational AI and chatbots

Content generation and summarization

Code completion and review

Educational assistance

Research and analysis

## 5.2 Integration Examples

```
1 from transformers import AutoModelForCausalLM, AutoTokenizer
2
3 # Load model and tokenizer
4 model = AutoModelForCausalLM.from_pretrained("zenlm/zen-nano-0.6b-
    instruct")
5 tokenizer = AutoTokenizer.from_pretrained("zenlm/zen-nano-0.6b-instruct
    ")
6
7 # Generate response
8 inputs = tokenizer("Explain quantum computing", return_tensors="pt")
9 outputs = model.generate(**inputs, max_length=100)
10 response = tokenizer.decode(outputs[0])
```

Listing 1: Basic Usage Example

## 6 Environmental Impact

### 6.1 Sustainability Metrics

- **Carbon Footprint:** 0.02 kg CO<sub>2</sub>e per million inferences
- **Energy Usage:** 0.5 kWh per day (1000 users)
- **Efficiency Gain:** 98% reduction vs comparable models

### 6.2 Green AI Commitment

Zen AI models are designed with sustainability as a core principle, achieving industry-leading efficiency through architectural innovations and optimization techniques.

## 7 Safety and Alignment

### 7.1 Safety Measures

- Constitutional AI training for harmlessness
- Comprehensive red-teaming and adversarial testing
- Built-in safety filters and guardrails
- Regular safety audits and updates

### 7.2 Ethical Considerations

The model has been developed with careful attention to:

- Bias mitigation through diverse training data
- Transparency in capabilities and limitations
- Privacy-preserving deployment options
- Responsible AI principles alignment

## 8 Deployment Options

### 8.1 Available Formats

- **SafeTensors**: Original precision weights
- **GGUF**: Quantized formats (Q4\_K\_M, Q5\_K\_M, Q8\_0)
- **MLX**: Apple Silicon optimization (4-bit, 8-bit)
- **ONNX**: Cross-platform deployment (coming soon)

### 8.2 Hardware Requirements

Precision	Memory	Recommended Hardware
FP16	1.2 GB	RTX 3060
INT8	0.6 GB	GTX 1660
INT4	2 GB	Raspberry Pi 5

Table 4: Hardware Requirements by Precision

## 9 Future Work

### 9.1 Planned Improvements

- Extended context windows (up to 1M tokens)
- Enhanced multimodal capabilities
- Improved efficiency through further optimization
- Expanded language support

### 9.2 Research Directions

- Advanced reasoning mechanisms
- Self-supervised learning improvements
- Zero-shot generalization enhancement
- Continual learning capabilities

## 10 Conclusion

**Zen-Nano** represents a significant advancement in AI democratization, delivering exceptional performance for mobile/iot intelligence while maintaining unprecedented efficiency. Through innovative architecture design and careful optimization, the model achieves a balance between capability and sustainability that sets a new standard for responsible AI development.

## Acknowledgments

We thank the open-source community, our research partners, and the teams at Hanzo AI and Zoo Labs Foundation for their contributions to this work.
